This form should be used for all taxonomic proposals. Please complete all those modules that are applicable (and then delete the unwanted sections). For guidance, see the notes written in blue and the separate document “Help with completing a taxonomic proposal”

Please try to keep related proposals within a single document; you can copy the modules to create more than one genus within a new family, for example.

**List the ICTV study group(s) that have seen this proposal:**

| A list of study groups and contacts is provided at [http://www.ictvonline.org/subcommittees.asp](http://www.ictvonline.org/subcommittees.asp) . If in doubt, contact the appropriate subcommittee chair (fungal, invertebrate, plant, prokaryote or vertebrate viruses) | ICTV Bacterial and Archaeal Viruses Subcommittee |

**ICTV Study Group comments (if any) and response of the proposer:**

**Date first submitted to ICTV:** June 2016

**Date of this revision (if different to above):**

**ICTV-EC comments and response of the proposer:**
MODULE 2: NEW SPECIES

Creating and naming one or more new species.

If more than one, they should be a group of related species belonging to the same genus. All new species must be placed in a higher taxon. This is usually a genus although it is also permissible for species to be “unassigned” within a subfamily or family. Wherever possible, provide sequence accession number(s) for one isolate of each new species proposed.

<table>
<thead>
<tr>
<th>Code</th>
<th>2016.051aB (assigned by ICTV officers)</th>
</tr>
</thead>
</table>

To create 2 new species within:

- **Genus:** Tsarbomba virus (new)
- **Subfamily:** Spounavirinae
- **Family:** Myoviridae
- **Order:** Caudovirales

Name of new species:   

<table>
<thead>
<tr>
<th>Representaive isolate: (only 1 per species please)</th>
<th>GenBank sequence accession number(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bacillus virus BCP78</td>
<td>JN797797.1</td>
</tr>
<tr>
<td>Bacillus virus TsarBomba</td>
<td>KT224359.1</td>
</tr>
</tbody>
</table>

Reasons to justify the creation and assignment of the new species:

- Explain how the proposed species differ(s) from all existing species.
  - If species demarcation criteria (see module 3) have previously been defined for the genus, explain how the new species meet these criteria.
  - If criteria for demarcating species need to be defined (because there will now be more than one species in the genus), please state the proposed criteria.
- Further material in support of this proposal may be presented in the Appendix, Module 9

We have chosen 95% DNA sequence identity as the criterion for demarcation of species in this new genus. The members of each of the proposed species differ from those of other species by more than 5% at the DNA level as confirmed with the BLASTN algorithm.
MODULE 3: **NEW GENUS**

creating a new genus

Ideally, a genus should be placed within a higher taxon.

<table>
<thead>
<tr>
<th>Code</th>
<th><strong>2016.051bB</strong></th>
<th>(assigned by ICTV officers)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create a new genus within:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Subfamily:</td>
<td><em>Spounavirinae</em></td>
<td></td>
</tr>
<tr>
<td>Family:</td>
<td><em>Myoviridae</em></td>
<td></td>
</tr>
<tr>
<td>Order:</td>
<td><em>Caudovirales</em></td>
<td></td>
</tr>
</tbody>
</table>

Fill in all that apply.
- If the higher taxon has yet to be created (in a later module, below) write **(new)** after its proposed name.
- If no family is specified, enter **unassigned** in the family box.

naming a new genus

<table>
<thead>
<tr>
<th>Code</th>
<th><strong>2016.051cB</strong></th>
<th>(assigned by ICTV officers)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To name the new genus: <strong>Tsarbombavirus</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Assigning the type species and other species to a new genus

<table>
<thead>
<tr>
<th>Code</th>
<th><strong>2016.051dB</strong></th>
<th>(assigned by ICTV officers)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To designate the following as the type species of the new genus</td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>Bacillus virus TsarBomba</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Every genus must have a type species. This should be a well characterized species although not necessarily the first to be discovered.

The new genus will also contain any other new species created and assigned to it (Module 2) and any that are being moved from elsewhere (Module 7b). Please enter here the TOTAL number of species (including the type species) that the genus will contain:

2

Reasons to justify the creation of a new genus:
Additional material in support of this proposal may be presented in the Appendix, Module 9

Bacillus phage TsarBomba, which infects *Bacillus thuringiensis* subsp. *Kurstaki*, was isolated in Russia [5]. It also infects *Bacillus thuringiensis* Bt DSM-350, Bt-18245 (PS52A1), Bt al Hakam, *Bacillus cereus* Gibson and FDA5, and *Bacillus anthracis* Sterne, but not *Bacillus subtilis* subtilis, *Bacillus simplex* RWR-2, *Bacillus megaterium* JJD118, *Bacillus pumilus* 113, or *Bacillus globegii*. The dimensions of Bacillus phage TsarBomba (Fig. 1) are the following:
- Capsid width (across the face) = 84.1 nm;
- Capsid length = 89.2 nm;
- Uncontracted tail length = 178.4 nm;
- Contracted tail length (neck to baseplate) = 96.3 nm.

Bacillus phages BCP78 and BCU4 (Fig. 2) were isolated in Korea from *Bacillus cereus* [4]. Bacillus phages BCP79 and BCU4, have nearly identical genomes (>96% DNA sequence identity) [6], and could infect several strains of *B. cereus* (ATCC 27348, ATCC 1661, and NRRL B-569), *B. thuringiensis* (KCCM 11429, KCCM 11579), and *B. subtilis* (ATCC 23857). Furthermore, the endolysins of these phages have identical domain structures containing cell wall hydrolysis/autolysin (PF01520) and SH3-like domains (PF08460) [6].
BLASTN, CoreGenes (Table 1) [2], progressiveMauve alignment (Fig. 3) [1], and phylogenetic analyses (Fig. 4) [3] all indicate that the proposed genus, *Tsarbombdavirus*, is cohesive and distinct from other genera. On average, the genomes of members of this genus are 159.3 kb in length (40.0 mol% G+C), and encode 237 proteins and 19 tRNAs. A genomic map for phage BCP78 is shown in Fig. 5.

**Origin of the new genus name:**

Unfortunately, there already is an ICTV-accepted genus of myoviruses called *Bcep78virus* (former *Bcep78likevirus*). In our opinion, naming a new genus *Bcep78virus* would cause too much confusion and we therefore propose to name the new genus *Tsarbombavirus*.

**Reasons to justify the choice of type species:**

Member of this genus which will not cause confusion in genus naming when chosen as type species.

**Species demarcation criteria in the new genus:**

If there will be more than one species in the new genus, list the criteria being used for species demarcation and explain how the proposed members meet these criteria.

We have chosen 95% DNA sequence identity as the criterion for demarcation of species in this new genus. The members of each of the proposed species differ from those of other species by more than 5% at the DNA level as confirmed with the BLASTN algorithm.

MODULE 10: **APPENDIX**: supporting material

additional material in support of this proposal

**References:**

Annex:
Include as much information as necessary to support the proposal, including diagrams comparing the old and new taxonomic orders. The use of Figures and Tables is strongly recommended but direct pasting of content from publications will require permission from the copyright holder together with appropriate acknowledgement as this proposal will be placed on a public web site. For phylogenetic analysis, try to provide a tree where branch length is related to genetic distance.

* Determined using BLASTN; ** Determined using CoreGenes [2]; *** phage BCU4 (JN797798.1) should be considered a strain of Bacillus phage BCP78 in this genus, sequence identity listed relative to BCP78.

Fig. 3. progressiveMauve alignment [1] of the annotated genomes of members of the *Tsarbombaviruses* genus – from top to bottom: Bacillus phages BCP78 and TsarBomba. Colored blocks indicate the regions of 1 to 1 best alignment with rearrangement breakpoints in a different random color. The degree of sequence similarity between regions is given by a similarity plot within the colored blocks with the height of the plot proportional to the average nucleotide identity (Aaron Darling, personal communication). N.B. The genomes are not collinear. Since the genome of TsarBomba has 6364 bp direct terminal repeats it should be the model for further alignment. Both Bacillus phage BCP78 and BCU4 genomes contain regions which are homologous to the TsarBomba direct terminal repeats.

Fig. 4. Phylogenetic analysis of A. major capsid protein and B. large subunit terminase proteins of Bacillus phage TsarBomba-like viruses and homologous proteins from a variety of other phages constructed using “one click” at phylogeny.fr [3]. "The "One Click mode" targets users that do not wish to deal with program and parameter selection. By default, the pipeline is already set up to run and connect programs recognized for their accuracy and speed (MUSCLE for multiple alignment and PhyML for phylogeny) to reconstruct a robust phylogenetic tree from a set of sequences." It also includes the use of Gblocks to eliminate poorly aligned positions and divergent regions. "The usual bootstrapping procedure is replaced by a new confidence index that is much faster to compute. See: Anisimova M., Gascuel O. Approximate likelihood ratio test for branches: A fast, accurate and powerful alternative (Syst Biol. 2006;55(4):539-52.) for details."
A. major capsid protein

B. large subunit terminase
